

## **Right Retention Policy for University of Agder**

The University of Agder (UiA) aims to ensure that scientific publications are openly accessible. Scientific articles should be made openly available through open access publishing channels or in open research archives. To achieve the institution's goal of open access, comply with funders' requirements, and at the same time respect researchers' right to choose where to publish, UiA has implemented the following rights retention policy, effective from November 1, 2023:

- UiA has a non-exclusive right to make all scientific articles (both journal articles and book chapters) authored by students and employees affiliated with the institution available under a Creative Commons license.
- Employees and students may exempt individual articles from this policy by requesting an exemption form. No justification is required for exemption requests.
- UiA will make scientific articles openly available in the institution's open research archive. Articles that are published openly under a Creative Commons license will be made available under the same license. For articles that are not published openly, the author's accepted manuscript will, as a default, be made available under a Creative Commons Attribution (CC BY) license.
- The Rector is legally responsible for interpreting the rights retention policy and resolving disputes regarding its interpretation and application.

This policy applies to scientific articles submitted from November 1, 2023, onwards. Articles submitted before this date are not covered by the policy.

UiA's employees are required to upload their accepted manuscripts of scientific articles to Norwegian Research Information Repository (NVA). In accordance with the rights retention policy, the manuscript will be made available without embargo and under a CC BY license. Researchers and students who wish to exempt individual articles from the policy may do so by submitting an exemption form. In the exemption form, they may also request that the author's accepted manuscript be made available under a different license than CC BY or that an embargo be applied to the manuscript.

If researchers experience critical reactions from publishers, they should contact UiA's Library Director. The Library Director will immediately escalate the matter for legal review, involve the university leadership, bring the issue to the academic community and the national publishing committee, and consult with other Norwegian institutions that practice similar rights retention policies.
